

Bulk combinations generator

Installation and configuration guide

Installation

Module is installed in a regular way: go to **Module Manager** in BackOffice and upload the archive

Basic definitions

Attribute - a standard product parameter. For example "RED" or "BLUE" or "LARGE"

Combination - a set of attributes combined together. For example "RED + LARGE" or "BLUE + LARGE"

Preparing attributes for combinations

Before creating/updating **combinations** you have to select **attributes** and optionally specify price/weight impacts for them. Impacts can be positive or negative, moreover they can have absolute or percentage values.

PREPARE ATTRIBUTES FOR COMBINATIONS

DUPLICATE COMBINATIONS FROM AN EXISTING PRODUCT

ADD ATTRIBUTES

ID	Name	Price impact (tax excl.)	Unit price impact	Wholesale price
1	Size: S	- 5 €	--	--
2	Size: M	+ 5 €	--	--
3	Size: L	+ 10 %	--	--

*NOTE: Prestashop doesn't have built-in functionality for **percentage** values of price/weight impacts. So, if you select a **percentage** based impact, the module will calculate the required value and save it as an **absolute impact** in a native way. For example, the base product price is **\$100**. You can set a price impact of **+10%** for "RED" color. In this case, all combinations with "RED" color will have a **+\$10** impact on price.*

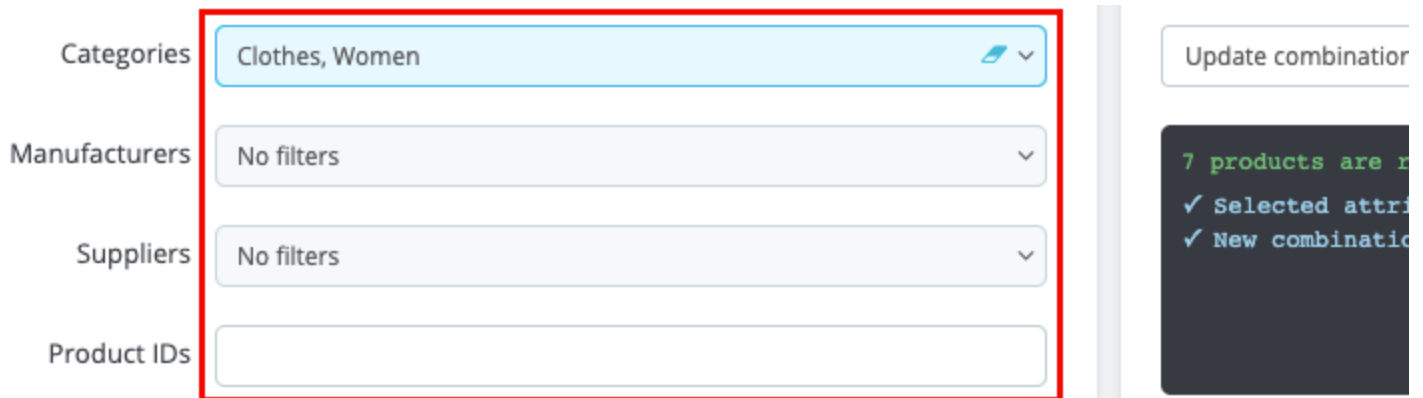

Specifying additional parameters

After configuring attributes you can specify common fields for new combinations: Quantity, Minimal quantity for order and optional Reference. Additionally you can specify what combination should be default: the first available, or the one with lowest (or highest) price/weight impact.

Default combination	Quantity	Min quantity for order	Reference
First available	100	1	{base_ref}_{iterate}

Defining products for processing

When attributes, impacts and other parameters are ready, you should define products for processing. Products can be filtered by Categories, Manufacturers, Suppliers or specified IDs.

The screenshot shows a web interface for defining products for processing. On the left, there are four filter categories: 'Categories' (set to 'Clothes, Women'), 'Manufacturers' (set to 'No filters'), 'Suppliers' (set to 'No filters'), and 'Product IDs' (empty). These filters are enclosed in a red rectangular box. To the right of the filters is a vertical grey bar. Further right is a dark grey panel containing a confirmation message: '7 products are ready for processing', followed by two green checkmarks and the text 'Selected attributes' and 'New combinations'. At the top right of the interface is a button labeled 'Update combination'.

Processing combinations

When required parameters are set, you can start processing combinations in one of the following ways:

- 1) **Update combinations (add new if required)** - Selected attributes will be combined with the attributes of existing combinations. As a result some attributes will be added to existing combinations, and also completely new combinations may be created. Additionally you can specify fields that should be updated for existing combinations: quantity, reference and price/weight impacts
- 2) **Update parameters of existing combinations (don't add new)** - This option updates only the specified parameters for combinations with selected attributes. These parameters include quantity, min. quantity for order, reference, and price/weight impacts. The main difference from the previous option is that selected attributes will not be added to existing combinations.
- 3) **Add new combinations (don't touch existing)** - New combinations will be created from selected attributes. Existing combinations will remain unchanged. Obviously if a combination with selected attributes already exists, it will not be processed.
- 4) **Re-generate all combinations** - All existing combinations will be deleted and then new combinations will be created from selected attributes.
- 5) **Delete combinations with selected attributes** - Combinations with selected attributes will be deleted
- 6) **Delete all existing combinations** - All existing combinations will be deleted
- 7) **Duplicate combinations** - All existing combinations will be deleted and then new combinations will be copied from the source product.

NOTES:

- *This module generates combinations in a native way, as if you added/updated them manually on the product sheet, and clicked the "Save" button. Generated combinations are seamlessly integrated in the PrestaShop system and exist independently from the module.*
- *Technically this module can generate thousands of combinations for each product. But we don't recommend generating more than 1000 combinations per product, because PrestaShop is not designed for that. If a product has too many combinations, it is very hard to maintain them*

Custom references for new combinations

In some cases references should be different for all combinations. You can prepare custom references basing on configurable patterns with the following variables:

`{id_product}` - ID of product, that is currently processed

`{base_ref}` - Base reference of product, that is currently processed

`{iterate}` - Iteration number for new combination, that is currently processed

`{att_names_5}` - Abbreviated attribute names in default language, maximum **5** characters per word. You can change **5** to any other number, like `{att_names_3}` or `{att_names_6}` etc...

`{orig_ref}` - Reference of original combination (during duplication)

`{orig_ref_without_base}` - same as `{orig_ref}`, but without base reference (during duplication)

Example 1: You define the reference pattern as `{base_ref}_{iterate}` and generate combinations for a product with base reference **demo_1**. In this case combinations will get the following references: **demo_1_1**, **demo_1_2**, **demo_1_3**, etc...

Example 2: You define the reference pattern as `{id_product}_{att_names_3}` and generate the following combinations for product product ID 15:

Combination Attributes	Reference <code>{id_product}_{att_names_3}</code>
Size: S + Color: PURPLE	15_s_pur
Size: M + Color: RED	15_m_red
Size: M + Color: YELLOW	15_m_yel
Size: L + Color: DARK BLUE	15_l_dar_blu
Size: XL + Color: GREEN	15_xl_gre

Example 3: You define the reference pattern as `{base_ref}{orig_ref_without_base}` and duplicate combinations from a product with reference **demo_1**. That product has a combination with color **Red**, and the reference of that combination is **demo_1_red**.

In this case `{orig_ref_without_base}` will represent **_red**, and `{base_ref}` will represent the base reference of product that gets new combinations from the source product. So, for product **demo_2**, the copied combination will have reference **demo_2_red**, for product **demo_3** it will be **demo_3_red**, and so on...

NOTES:

- *Reference is not a required field. If you don't know what references should be used for your combinations, you can leave it empty.*
- *Maximum allowed length for a **combination reference** is 32 characters. If generated reference has more than 32 characters, it will be automatically truncated*

Import/Export settings

If you have prepared a set of attributes with many different impacts and you are planning to use the same settings later, you can export them by clicking the **Export** button. Settings will be saved as a regular txt file. Next time when you want to use them again, click **Import**, then upload the saved file and settings will be filled automatically.
